

Robot Demo Runbook

Cleaned and structured from handwritten setup notes. Prepared as an operator-facing sequence for the live demo.

Quick navigation	Meaning
Run t10	Open 10 terminals
Ctrl + PageUp	Next terminal
Ctrl + PageDown	Previous terminal

Startup

Open a terminal and run **t10**. This should create ten terminals for the demo workflow.

Use **Ctrl + PageUp** and **Ctrl + PageDown** to move between terminals during setup.

The handwritten note marked **CP** means **Control + PageUp**, i.e. advance to the next terminal before running the next stage.

Launch sequence by terminal

Stage	Action	Operator note
S1	Open camera parameters	Then press Control + PageUp
S2	Open rectified image parameters	Then press Control + PageUp
S3	Start AprilTag detection	Then press Control + PageUp
S4	Launch robot description / robot launcher	Then press Control + PageUp
S5	Start mapping between ROS 2 joint names and the launch-file naming	Then press Control + PageUp
S6	Run TF estimation	Then press Control + PageUp
S7	Launch RViz	Verify visualisation after launch
S8	Get transformation values	Used after RViz verification and query.cfg step

Verification and execution

After **S7**, confirm that RViz can find and display the expected objects, especially the **AprilTag**.

Return to the terminal window, then move to the next terminal and run the **query.cfg** step before **S8**.

After **S8**, enter the Docker container using **dock**. If the terminal is glitchy, press **Enter** twice.

Run **getp** to generate the plan and inspect the visualization.

If the plan is correct, run **runp** to execute it on the robot.

Operational caution

Do not execute **runp** until the RViz output and the visualization from **getp** both look correct.

Note: a few words in the source note were ambiguous. This version preserves the intended order and the clarified meaning of CP as Control + PageUp.
